# Shell Desk Parts / Polystyrene shells, wooden top and legs, 6 screws

# Shell Desk Assembly / Easy and minimal assembly, interlocked parts creates a strong durable construction

The desktop hinges open to access internal storage which is divided into compartments via the positioning of the structural components.

The back edge of the top has been shaped with a rounded offset cylinder which acts as a long hinge, allowing it to rotate smoothly without using any hardware.

Internal structure works as storage for different sizes of office supplies.

A small compartment in the back of the desk will fit any power strip, cable management and plugs for hardware. a discreet groove in the back of the panel provides a place for cables to be run up to the desktop.

A hole in the bottom allows the main power supply to be run through. Along with the back storage compartment and the cable management grooves it allows the desk to accommodate for changes in technology, or the removal of technology without the function being compromised.
