## History has proven that in times of crisis, innovation can flourish.

Penicillin was first used as a lifesaving antibiotic on a patient in 1942. Facing the casualties of World War II, the US government called on pharmaceutical companies across the country to chip in on the war effort by making penicillin product a priority.

Traditionally slow and intensive to produce, Pfizer combined its knowledge of fermentation with the specific conditions of penicillin to discover a rapid production method that treated an estimated 100,000 soldiers.

**Collaboration** is the **key** to **effective response in crisis.**

The modern ventilator is a sophisticated device. At its most complex, it enables precision tailoring for a wide-range of ventilation needs.

With Covid-19, medical systems around the world are overburdened. Access to this lifesaving device presents a challenge for health care settings experience peak surges as well as low resourced hospitals with limited ventilator supply.

**The global ventilator supply is not enough. The medical community has issued a call to action to designers and engineers.**

**A team of designers and engineers  
banded together to optimize the ventilator  
for an overburdened supply chain  
constraining health care capacity.**

**fuseproject**

Design & Innovation

CIONIC

Medical Device Technology

Independent  
Consultants

Mechanical Engineering

**Our approach stems from a fundamental belief that innovation starts with human insight.**

Our design is the result of **continual collaboration with health care professionals** in order to ensure an intuitive, improved experience for those working with the life-saving device.

Introducing

A pneumatically-driven ventilator, optimized for a Covid-19 health care context and assembled in under 4 hours

---

# We looked to the context for innovation clues

With accidents down and elective surgeries canceled, hospitals are operating at as low as 50% capacity.

VOX leverages the ubiquitous IV pole enabling speedy manufacturability, adjustable placement in use, easy transport, and simple storage.

---

# Designed for safe & accurate delivery

Ventilation, while lifesaving, introduces additional dangers of lung injury from volume or pressure trauma – especially true for long term use of bag valves (also known as ambu bag) as a ventilation device which present the potential of air valve collapse.

A pneumatic valve ventilation system offers the safest delivery of lifesaving ventilation.

Round 2 Addition

# Eliminating unnecessary exposure to our health workers

Health workers around the world are going to great lengths to limit their personal exposure. VOX's dashboard functionality allows health workers to monitor and even operate multiple ventilators from a single desktop computer or tablet, drastically limiting personal exposure to the disease.

---

# Leveraging the best of 3D printing to simplify assembly

Our design maximizes use of Stratasys' advanced polyjet printing technologies and library of materials for optimized assembly.

Combining outer shell and housing, the unit leverages multi-material and multi-color printing functionality to include venting, fasteners for assembly, Venturi tubes and even exterior UI details like buttons and icons.

# Adaptable for each unique care setting

Each hospital is unique in design, workflows, and built environment. The refinement of our design focused on flexibility and adaptation, including a customizable UI flow.

Additionally, VOX's multi-device dashboard capability opens up the possibility of a screen-free device. Low-resource contexts can opt to remove the built-in screen and leverage external mixing, thus minimizing materials and processes and reducing the overall cost of the device.

**VOX is the integration of many solutions optimizing for flexibility, manufacturing & assembly while delivering a best-in-class user experience.**

Intuitive User  
Experience

Intelligent  
Manufacturing

Simplified  
Architecture

# Intuitive User Experience

There's no time to learn a new machine. VOX was designed with affordance to leverage existing user behaviors, while enabling a customizable UI tailored to each hospital's unique work flow.

## Ease of installation, transport & storage

- Simple attachment mechanism for variably sized poles, additionally allowing user to adjust height for comfort
- Leverages built-in mobility of IV poles for easy transport
- Detaches from poles for space-saving storage

Tube support arm

Power cable

## Organized tube and cable management

- Tube support arm improves angle of tube-to-patient connection, reducing accidental disconnections
- The cable management back cover provides a clean storage solution for the power cable while also hiding the pole clamps.

Rotary dial

Buttons

Ergonomic interface

# Intuitive navigation and legibility

- Simple rotary dial for menu navigation and incremental adjustments
- Two easy to identify main buttons for of critical function oxygen boost and alarm silencing
- Angled face to improve ergonomics of the device

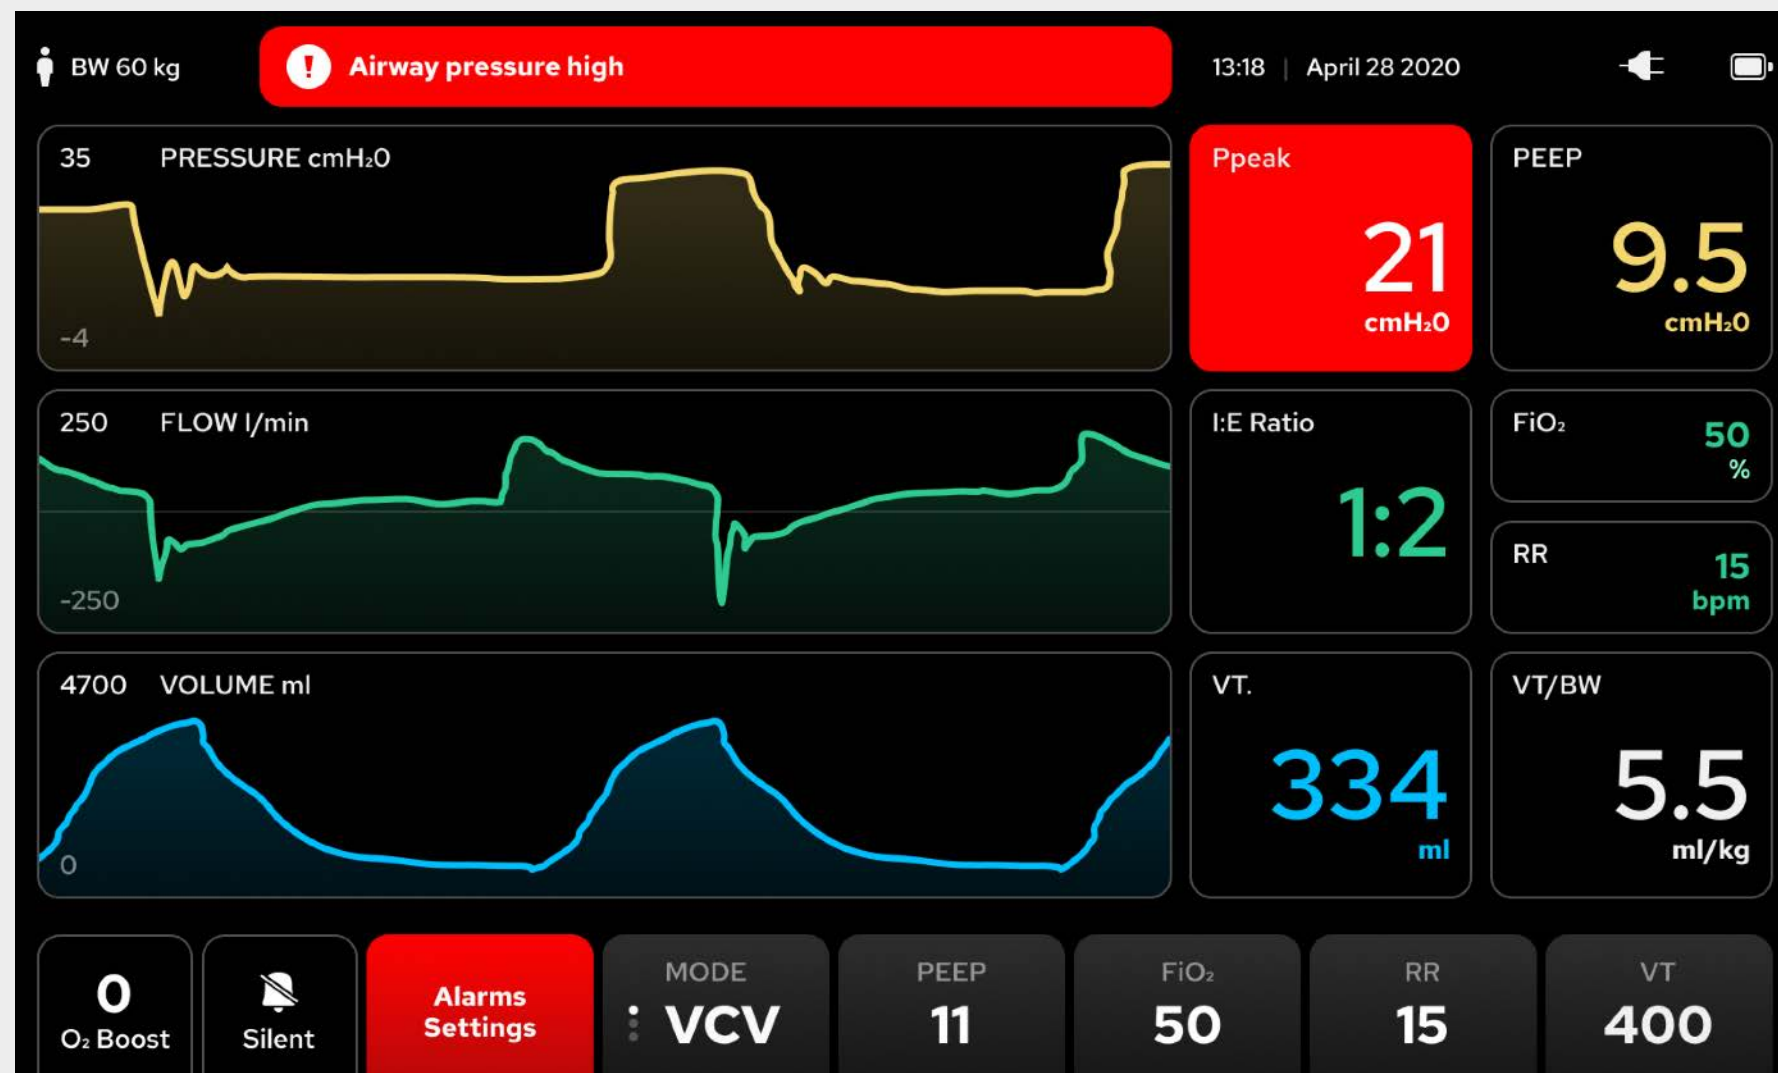

# Familiar UI and controls

- Valuable waveform monitoring for pressure, flow and volume
- Simplified interpretation with grouped inputs and outputs
- Color coding to distinguish key inputs and outputs

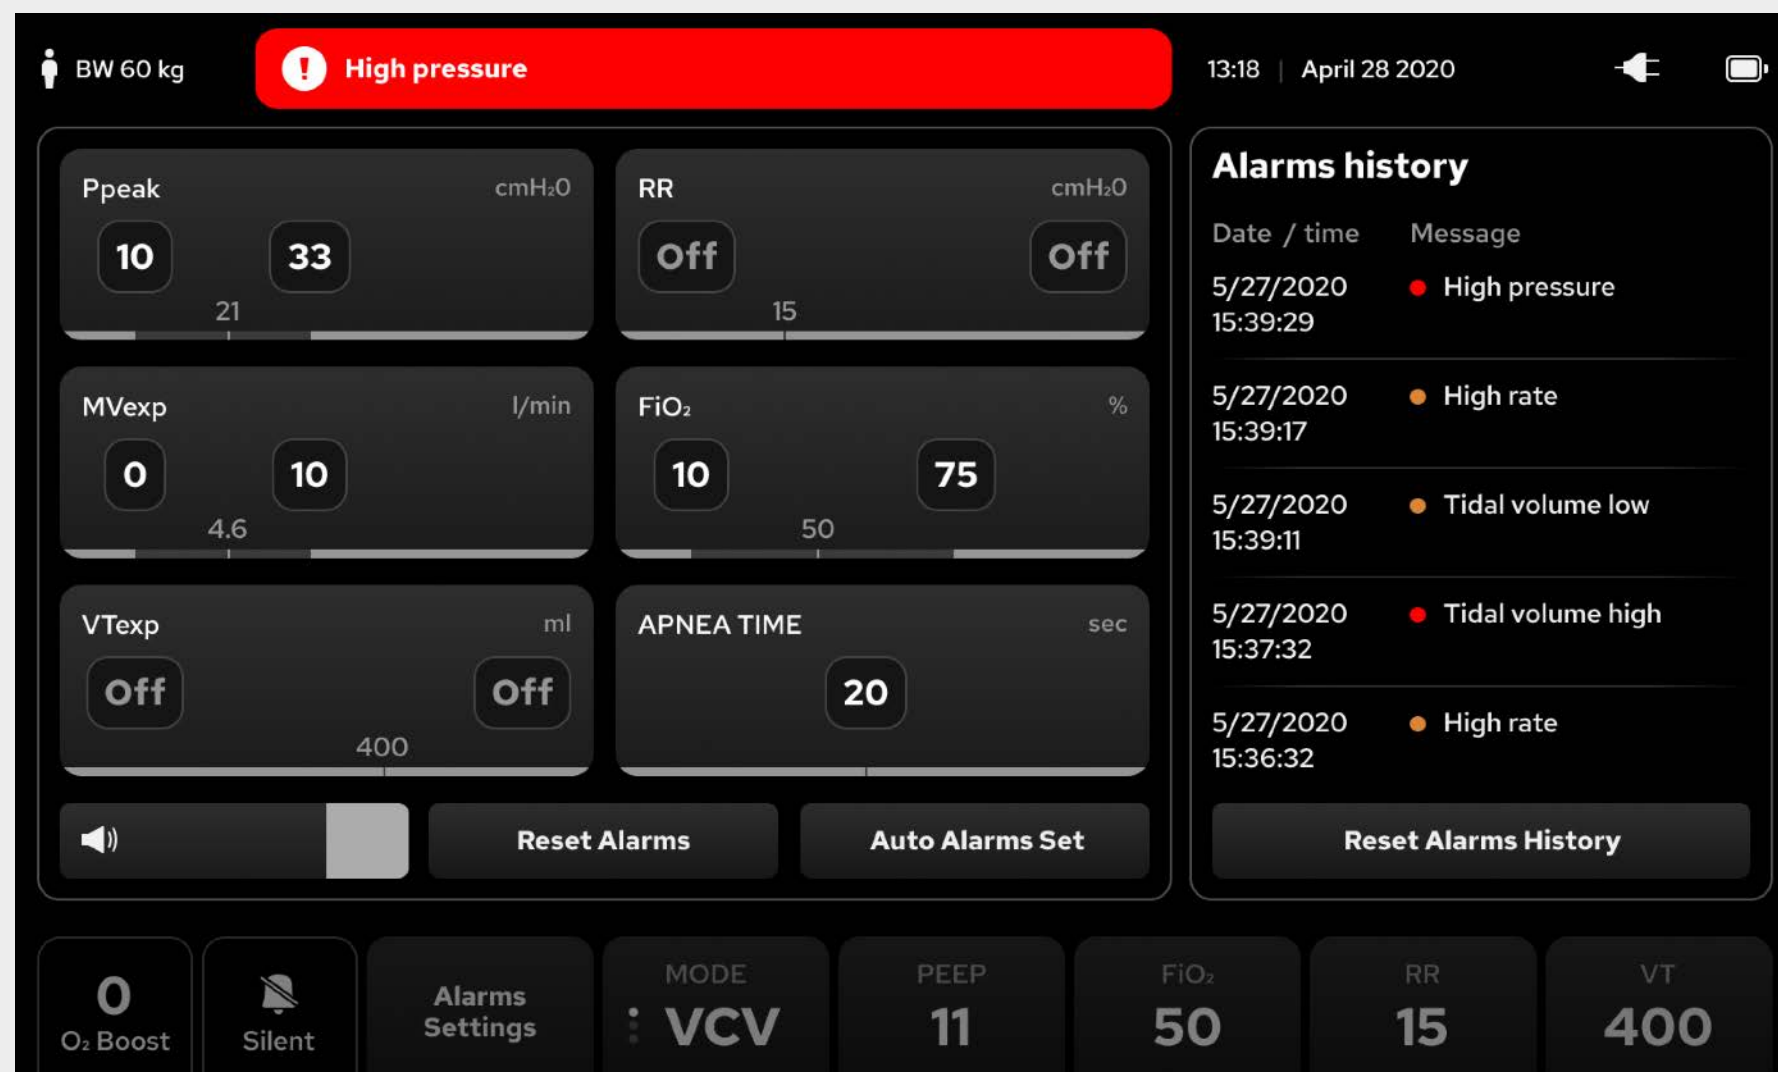

## Round 2 Refinement:

- Customizability to tailor sequencing of inputs and outputs to each hospital's unique workflow

Alarm settings

Alarm controls

# Simple alert states with streamlined management

- A highlighted alert area pairs with messaging on the top of the screen to allow for quick scanning and comprehension.

**Round 2 Refinement:**

- Volume control and sound signatures by alarm type
- “Auto alarm set” with a pre-programmed parameters standard for coronavirus patients

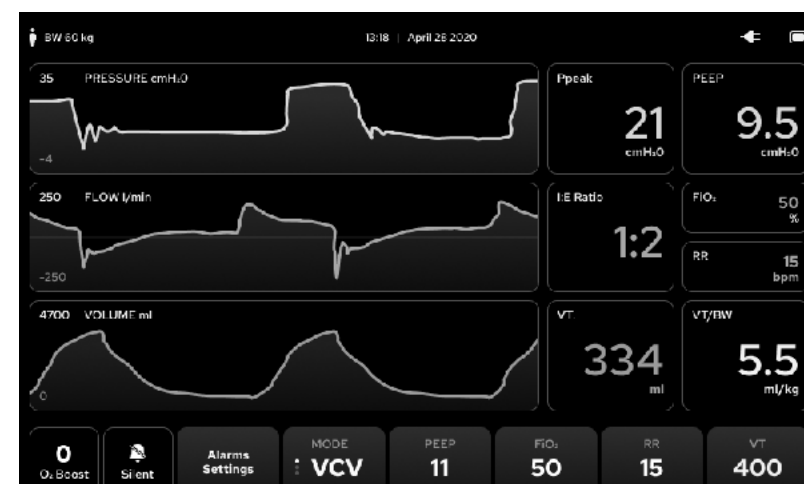

# A multi-device dashboard

- A single dashboard view for monitoring up to 4 ventilator devices on a single desktop computer, tablet or smart phone device
- Additional capabilities to operate ventilator include alarm management, O2 boost, and ventilation settings

# World Wide Web (W3C) Accessibility Consortium

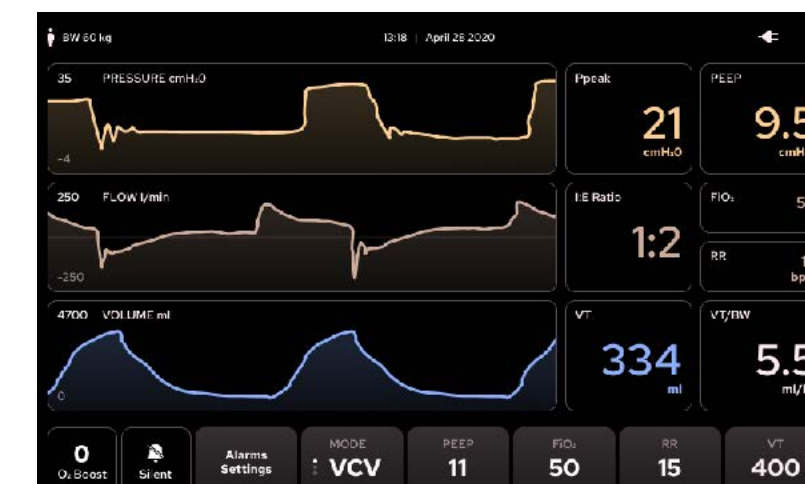

Our product's accessibility enhance the usability for all users, including those with low vision. Our UI meet (W3C) AAA grade contrast ratio and works across color blindness visions.

Achromatopsia vision

Deuteranomaly vision

Deuteranopia vision

Protanomaly vision

Tritanomaly vision

Tritanopia vision

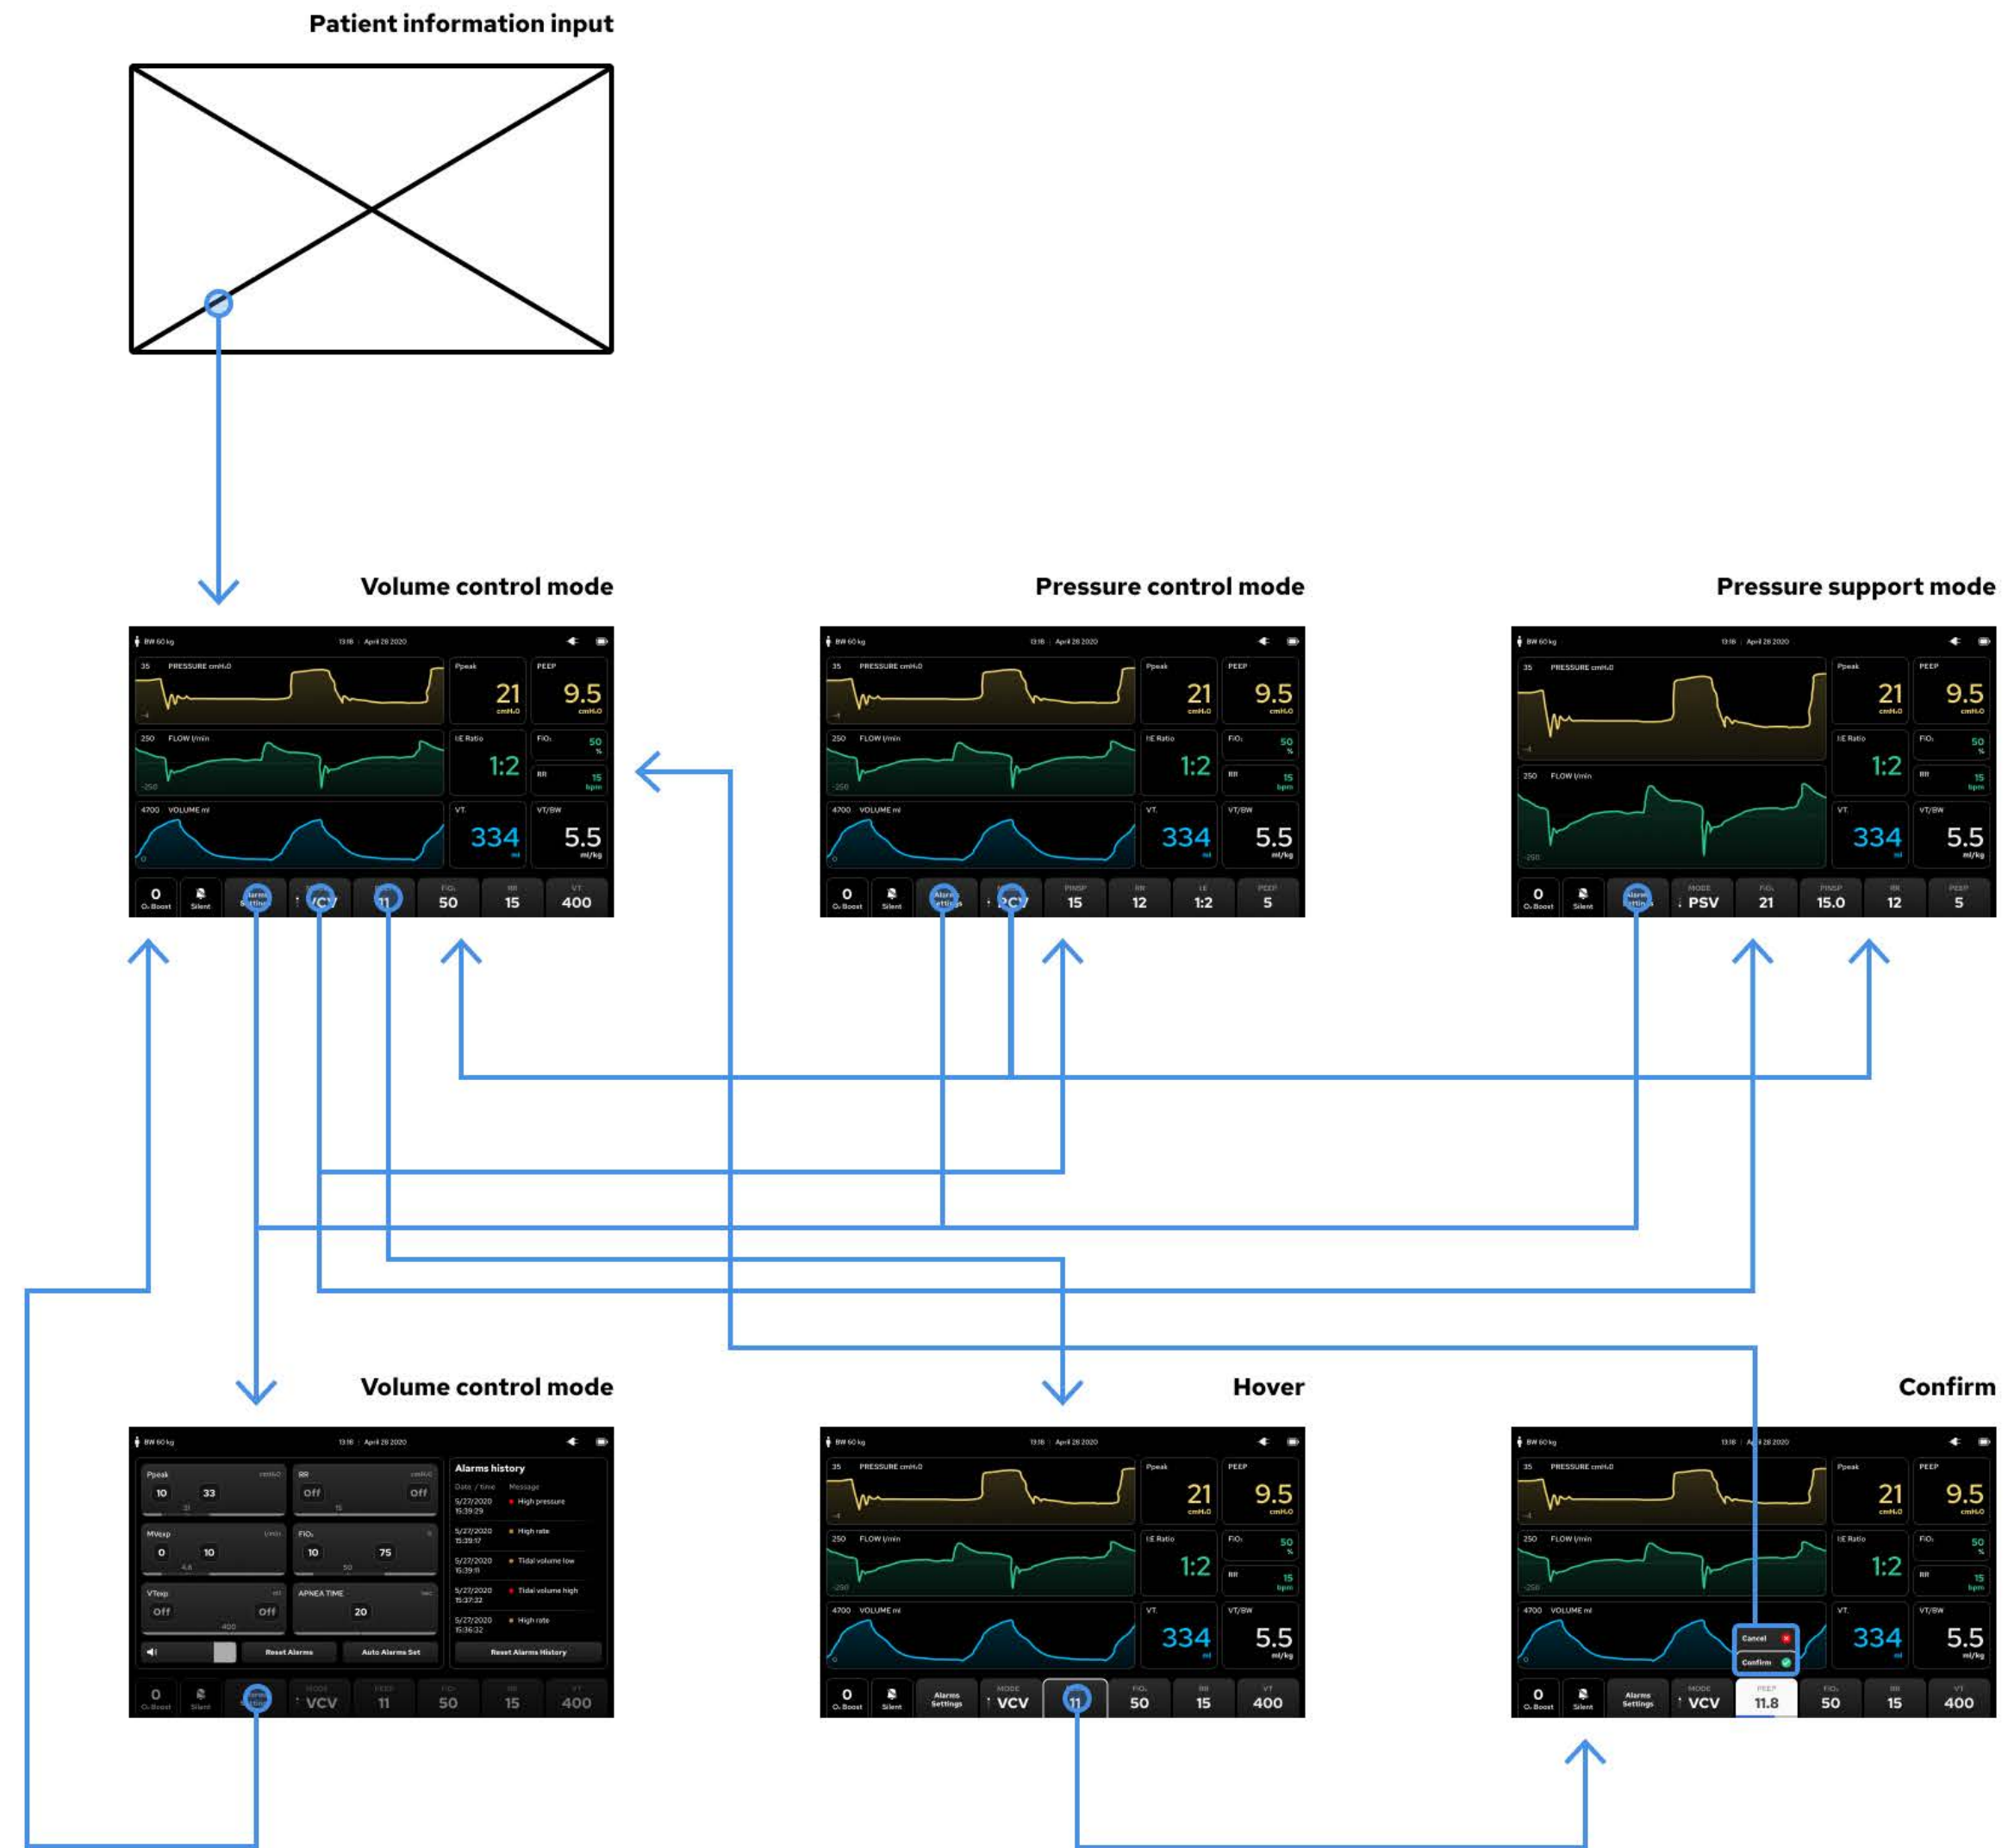

Achromatomaly vision

Protanopia vision

# UI flow

# | Intelligent Manufacturing

Great ventilator models exist. The real opportunity here is getting this made fast, reducing time-to-market with simple manufacturing processes that scale globally.

## Educated material selection

- Leveraging Stratasys 3D printing technology for multi-material, multi-color in a single print to eliminate labelling, assembly and post-processing, streamlining processing and production time.
- Optimized size, form and material of aluminum for durability and protection
- Single bend aluminum front plate which can be fabricated cheaply at most metal fabricators
- Virus persists on aluminum for 2-8 hours, compared to 48 hours on steel.

Exploded view - Sub-assemblies mount to 3D printed body

## Simplified assembly

- Fewer parts minimize need for fasteners.
- Design without adhesives cuts assembly time.
- Reduction in components significantly reduces assembly errors.
- Self-tapping screws remove the need for threaded inserts, speeding up assembly time.
- Removable pneumatic and screen sub-assemblies are designed to modularize production workflow.

# Exploded assembly

IV Poles from empty rooms in hospital wards

Standard Pole clamp

Plug in wall mount air supply

# Leveraging hospital equipment

- Due to the decline in ER visits and elective surgeries, precious ER equipment including IV poles sits unused.
- Flexible clamping mechanism can adapt to other pole attachments in a hospital setting.

# | Simplified Architecture

Ventilators can have an incredible range of capabilities and features. Explore alternative technologies to focus on what's most necessary for Covid-19.

# Pneumatic operation system

- Leverages existing pressurized air system in hospitals instead of mechanical actuation.
- Lighter more manageable form factor.
- Sensors mounted directly to Venturi tubes
- Built-in overpressure relief valve for safety.
- Simple variable timing and flow control.
- Spontaneous mode supports patient triggered ventilation.
- Components with proven long-term reliability.

Off The Shelf Sensors

Single Board Computer

Standard Display

Proportional Solenoid Valves

# Maximizing OTS + serviceability of parts

- Subassemblies allow for easy serviceability
- Open hardware and open software
- Highly responsive solenoids

## Simple design, sophisticated functionality

- Pneumatic approach simplifies entire system size and complexity compared to a mechanical design.
- Hidden fasteners built into aluminum face plate for simplified sterilization.
- Embedded air mixture tank and Venturi tubes are 3D printed to reduce cost and manufacturing time.
- Leverages standard IV poles for mounting.

# Putting it all together

This last sprint has been about putting together more than just a ventilator that looks good on paper, but a ventilator that works.

# Assembly video

**Intuitive user  
experience,  
intelligent  
manufacturing,  
simplified  
architecture**

## Thank you to our medical experts...

**Rob Bautista**

ICU Respiratory Therapist, UCSF

**Lindsay Ryan**

Emergency Physician, San Francisco VA Medical Center ER

**Robb Johnson**

Chief Perfusionist, Saint Joseph Mercy Oakland Michigan

**Bob Hankins**

Ventilator Expert, Nordson Medical

**John Feiner**

Professor, UCSF Department of Anesthesia and Perioperative Care

**Dave Holtzclaw**

Anesthesiologist, Mills Peninsula Medical Center

**Fiona Holtzclaw**

BS, BSN, RN, PCCN, Stanford Hospital

**Ayla Pelleg**

Professor, Icahn School of Medicine at Mount Sinai

**Amanda Foote**

ICU RN, Hospital of the University of Pennsylvania

**Bryan Hahn**

ICU RN, Summit Medical

**...and all of our frontline workers.**

---

# Next Steps

- Develop Assembly Instructions to support final assembly of prototype
- Consult with Ximedita on completion of the Design History File
- Continued develop of UI flows, including onboarding and multi-device desktop dashboard
- Partnership with the African Federation for Emergency Medicine to conduct primary research focusing on the care context and user experience of Nigerian hospitals in order to identify additional design opportunities

# | About fuseproject

## **Building “firsts” and category leaders**

fuseproject is an integrated design and innovation firm founded by world- renowned Swiss designer, Yves Behar. We are most known for creating "firsts" and category leaders. We take a human-centered, sustainable approach to design to improve the way people go about their everyday lives. We approach every step in the design process with an eye towards executing the offering successfully in market.

Our globally diverse team of 100 experts, based in San Francisco, brings a range of backgrounds and expertise that bridges disciplines and spans industries—including retail, automotive, robotics, consumer, software, technology, telecommunications, finance, and many more. Our capabilities include innovation strategy, sustainability, branding, industrial design & packaging, environment design and activations.

# | About Cionic

**Building precision bionics to enable a world without limitation.**

Despite the incredible progress of the digital age, we have made very few advances in improving mobility for individuals suffering from neuromuscular disease. Inspired to help his daughter navigate her diagnosis of cerebral palsy, Jeremiah Robison founded Cionic on the belief that technology could offer more than crutches, canes, walkers, and wheelchairs.

Cionic builds wearable solutions that provide comprehensive analysis and precise augmentation to enhance human performance and improve quality of life. Our devices push the limits of integrated hardware, predictive modeling, and software design, emphasizing functional wearability and personalized intelligence.
